TITLE:

A simplified method for plotting root loci

PERIODICAL:

Avtomatika i telemekhanika, v. 24, no. 2, 1963,

268-270

TECT: The analytical method developed earlier by the authors for plotting the root loci of a linear equation, depending on one variable parameter only (Avtomatika i telemekhanika, v. 20, no. 3, 1959) can be simplified in the case of a low-order equation if the original equation contains explicitly the initial and final points of the loci. The method proposed in the present article, is based on the following properties of the loci: 1) the family of loci is determined uniquely by the relative position of their initial and final points, 2) the shifting of the imaginary axis does not affect the form of the root locus. It must be found at which frequencies the root loci intersect the imaginary axis of the complex

BENEFIT OF PERSON L 10092-66 EWT(d)/EWA(m)-2 IJP(c) ACC NR AP5020242 SOURCE CODE: UR/0188/65/000/004/0073/0077 Teodorchik, K. F. del, S AUTHOR: ORG: Department of Physics of Oscillation (Kafedra fiziki kolebaniy) x 16,44,55 Stability Limits of linear system resulting from the regularity of the move-TITLE: ment of the roots along the trajectory and their relation to Hurwitz stability criteria Hoscow, Universitet. Vestnik. Seriya 3. Fizika, astronomiya, no. 4, 1965, SOURCE: \ 73-77 TOPIC TAGS: stability constant, characteristic function, polynomial equation, mathematic determinant, complex function ABSTRACT: The stability of n-degree polynomials was solved in several different forms by Hurwitz and others. The Hurwitz conditions, however, are inconvenient for actual computation. From the definition of stability all the roots of the characteristic equation (the equation of free motion) must have negative real roots (i. e., lie on the left hand side of the imaginary axis in the complex plane). But for degrees higher than three it is difficult to solve for the roots. An algorithm is presented that, given the stability of the equation of n-degree, one finds the significant limits of a free term which relates the n-degree equation to one of n + 1 degree, in-UDC: 62-502.12 Card 1/2

Title

: Interspecies Hybrids of Domestic Ducks

Orig Pub : Probl. zootehn. si veterin., 1956, No 8, 47-49

Abstract : Hybrids produced by crossbreeding of common gray ducks with Polish ducks (Anas boschas and A. moschas) are described. The hybrids do not resemble either of their parent breeds and can not be considered as intermediate forms. They develop faster (crossbreed vigor). Males as well as females

are sterile .-- M.A. Bernsteyn

Orig Pub: Bul. stiint. Acad. RPR. Sec. biol. si stiinte agric. Ser. agron., 1957, 9, No 1, 51-69.

Abstract: The quantity of preceipitation in a year in different districts of Rumania was taken as a basis for the regional division of the breeds of sheep as follows: for fine-wool sheep - 600 mm., for semi-fine-wool sheep - 800 mm., for coarse-wool-sheep - over 800 mm., for Karakul sheep - 540 mm., and for Karakul hybrids - 500-550 mm. The districts where various breeds of sheep are being raised are indicated.

Studies on the Lipid Spectrum of Plasma in Some Categories of Soldiers."

Bucharest, Revista Sanitara Militara, Vol 62, No 4, Jul-Aug 66, pp 683-690.

Abstract: The authors studied the plasma lipid spectrum of a group of 224 healthy soldiers, average age 32 years, divided into 3 groups according to age and diet pattern. They found that the average range of cholesterolemia in the age range 25 to 35 years is normally 150 to 200 milligram-percent, with values above 250 definitely abnormal. A direct causal relation was found between the percentage of lipid calorigenic tropines in the diet and changes in the lipid spectrum of the plasma.

"Considerations on the Tonus and Position Changes in the Stomach Under the Condition of Exposure to Acceleration During Flight."

Bucharest, Revista Sanitara Militara, Vol 59, No 3, May-Jun 63, pp 487-490.

Abstract: A study of the etiopathogenic relations between digestive tract affections and conditions encountered during flight. Repeated exposure to acceleration under continuous and normal flight conditions does not lead to lasting changes in the tonus and position of the stomach, except when the flight program and food-hygiene measures are not upheld. The authors suggest that an adequate rest, work and nutrition program is all that is required for continuously flying personnel. Includes 2 figures.

TITLE:

Extracting germanium concentrate from the ammonia liquor of coking

plants

PERIODICAL: Revista de Chimie, v. 12, no. 9, 1961, 508-511

The article describes experiments conducted on the precipitation of ger-TEXT: manium with tannin from ammonia liquor. Precipitation was achieved by mixing 1-1.5 lit of ammonia liquor with a solution of 5% tannin and 17% FeCl3. The mixture was agitated for 10 minutes and decanted. After 24 hours, 3/4 of the total quantity was syphoned and analyzed to establish the quantity of non-precipitated germanium. A 90% precipitation yield at a concentration of the final solution below 0.1 g Ge/cu m was obtained by heating the solution to 80°C and simultaneously reducing the pH value to 2-2.5 and adding 50 g tannin/g Ge. Due to the very low percentage of germanium concentration in ammonia liquor, heating to 80°C and reducing the pH are no longer economical. Thus, a series of experiments have been conducted by varying the precipitation factors. The solutions used had an

Card 1/4

R/003/61/012/009/002/008 D019/D105

initial concentration of 14 kg NH 3 /cu m and 2.6 g Ge/cu m at pH 8. Precipitation

was carried out at 20°C, with 100 g tannin and 200 g Fe 34 per g of Ge, in a solution with pH 8. It was found that within the initial concentration of 0.17-2.6 g Ge/cu m, the efficiency of tannin, i.e. the precipitation yield, was practically constant, with the final solutions reaching a concentration of (0.1 g Ce/cu m. The precipitates contained ~ 200-300 g/t Ge, but after calcining the content increased to 600-700 g/t. The precipitation yield of germanium did not exceed 60% when 100-200 g tannin/g Ge were added. To determine the size of precipitation granules, two series of tests were carried out. One series of tests which was carried out by filtering a mixture of tannin and ammonia liquor with a no. 3 Gooch filter and filter paper, established the variation in size as dependent on time. After 120 hours of agitation, the total germanium was included in granules, the size of which exceeded 20 - 30 M. The second series of tests was carried out by agitating the mixture of ammonia liquor and tannin for only 10 minutes, followed by decantation. After 72 hours the granules showed a yield of 65% while with continuous agitation for 72 hours the yield was 30%. Coagulation and separation of particles took a little less time in case of con-

Extracting germanium concentrate

tinuous agitation. By centrifugation for 15 minutes at 1,700 rpm, the result was similar to that achieved with 5 days of mechanical agitation or with over 7 days of decantation. The separation of germanium amounted to 80% in case of analysis of a clear solution obtained in a test tube by centrifugation, and to 98% when the solution was filtered prior to the analysis. Precipitation with tannin of germanium from ammonia liquor includes (a) partial coprecipitation of ferric ions and germanium in an alkaline medium and their immediate separation once the reaction has begun and (b) colloidal-type reaction of tannin with germanium, leading to the formation of insoluble compounds. Conclusions: (1) addition of 100 g of tannin and 200 g of iron/g Ge from ammonia liquor is sufficient; (2) a filter of particular fineness should be used in separating the precipitate; (3) solutions should be mixed as thoroughly as possible; (4) separation of ~ 70-80% of germanium may be achieved within 1-2 hours by mechanical agitation, followed by filtering through a 20-30-A filter; (5) products containing tannin may be used instead of pure tannin and (6) the average composition of germanium precipitates obtained from ammonia liquor with a content of ~1 g/Ge cu m is: C, 16.7%, Pb, 0.021%, Cu, 0.01%, Zn, 0.95%, SiO2, 0.39%, Al2O3, 2.02%, Fe, 15.3% and Ge, 0.02%. TITLE:

A Gyrotron With Controlled Grids

PERIODICAL: Elektrichestvo, 1960, No. 6, pp. 68-70

TEXT: The gyrotrons with uncontrolled grids invented by the author can be applied advantageously to the production of high-frequency currents with high amperage. In the present paper, a discussion is offered of the mode of operation of a gyrotron with controlled grids and some of their characteristics are dealt with. The mercury molecules in the central tank are kept in an excited state which is close below the ionization energy. The difference compared to other ion converters is in the space near the anode in that the molecules have a lower excitation in the gridanode space than in the tank. Therefore, the molecules in the gridanode space require more energy for ionization than those from the tank. In the case of the gyrotron, this energy is achieved by a bombardment of electrons moving under the action of the electromagnetic field. A local increase in amperage is caused by controlled grids. Fig. 1 shows a

cross section and a circuit diagram of a gyrotron with controlled grids. The change-over of the arc from anode A to anode B (Fig. 2) occurs either if the molecules near B attain the ionization state or if the molecules in this space are in the excited state, if a control voltage is applied to the grid. The distance between the anodes bears a considerable influence upon the gyrotron operation. The gyrotron control takes place with positive pulses on the grids or also by applying a sinusoidal voltage to them. The latter mode of controlling, however, has certain drawbacks; still, it frequently suffices for practical requirements. A special circuit, connected with the secondary circuit of the transformer is required for the pulse control. Fig. 3 illustrates the dependence of the frequency on the induction of the outer magnetic field. Controlled and uncontrolled gyrotrons with six and with four anodes are compared among one another. On a change of the outer magnetic field, uncontrolled gyrotrons are found to exhibit a considerably greater change in frequency than controlled gyrotrons. A determined critical induction is required for the stability of the operation. Voltage and current of a gyrotron are finally dealt with (Figs. 5-8) and the construction of a gyrotron is discussed. The water-cooled tank is made of austenitic steel,

Abstract: Describes the materials and methods used for the preparation of a new culture medium for meningococci that also proved useful for the isolation of strains. It contains corn, glucose and agar extracts and, for more difficultly cultivable strains such as type I (628), type A Pasteur (52,136) and type A Pasteur (52,137), defibrinated sheep's blood. It is easily prepared and 20 times cheaper than the media used so far. Includes I table and 10 references.
